Mobile HT-100

Leak Detection System for Bulk and Hydrant Pipelines

The mobile version of the HT-100, Vista's best-selling leak detection system for underground bulk pipelines and airport hydrant fueling systems, delivers the same performance as the standard HT-100 while offering greater flexibility. It is a popular choice at facilities that want to make maximum use of their equipment across a widespread network of lines.

Like the standard, permanent installation, the mobile HT-100 combines high performance with ease of use. The mobile HT-100 is mounted in the back of a small truck or trailer. Tucked next to the HT-100, at either the front or back of the truck/trailer, is a compact but fully functional office that houses a computer, a printer, and other electronics. The operator starts the test from here, using the HT-100 software. Results are automatically archived on the computer's hard drive.

The HT-100 is connected to the pipeline through an opening in the side of the truck/trailer.

The mobile HT-100 can be transported to distant lines for periodic testing. In some cases it is used by different facilities, which apportion costs commensurate with usage.

Vista's testing services are conducted with a mobile HT-100 housed in a trailer.
